Information about Copyrighted Content

Some instruments administered as part of this study may contain in whole or substantially in part contents from copyrighted instruments. Reproductions of the instruments are provided as documentation for the analysis of the data associated with this collection. Restrictions on "fair use" apply to all copyrighted content. More information about the reproduction of copyrighted works by educators and librarians is available from the United States Copyright Office.

NOTICE
WARNING CONCERNING COPYRIGHT RESTRICTIONS

The copyright law of the United States (Title 17, United States Code) governs the making of photocopies or other reproductions of copyrighted material. Under certain conditions specified in the law, libraries and archives are authorized to furnish a photocopy or other reproduction. One of these specified conditions is that the photocopy or reproduction is not to be "used for any purpose other than private study, scholarship, or research." If a user makes a request for, or later uses, a photocopy or reproduction for purposes in excess of "fair use," that user may be liable for copyright infringement.

ICPSR PROCESSING NOTES FOR #35604
United States Census of Manufactures, 1929-1935, Motor Vehicles Industry

1. **Sequential Record Identifier:** ICPSR created a unique sequential record identifier variable named **CASEID**.
2. **Duplicate Variable Labels:** The variables **GMW5** and **GMWO5** were provided with identical labels as were the variables **GTRAC_FARM_V** and **GTRAC_ROAD_V**. Each variable's name has been added to the end of its label to make it unique. No additional information was provided.
3. **Collection Update:** This collection is an edited version the Motor Vehicle Industry data from ICPSR Study #31761: Census of Manufactures, Motor Vehicle and Textile Industry Plants, 1929, 1931, 1933, 1935 [United States]. Changes include editing erroneous and missing information as well as reorganizing the data into industry specific datasets.
4. **Additional Information:** For related information regarding the Census of Manufactures, please visit the United States Census Bureau's [Annual Survey of Manufactures](#) Web site and the United States Census Bureau's [Economic Census](#) Web site.

**Census of Manufactures: Motor Vehicle and Textile Industries
Plants 1929, 1931, 1933, 1935 [United States]**

Codebook
March 2, 2015

Principal Investigators

Bresnahan, Timothy, Stanford University
Raff, Daniel G., University of Pennsylvania

Enhanced by

Changkeun Lee, University of Michigan
Margaret C. Levenstein, University of Michigan

Summary

This is a newer version of Bresnahan and Raff's "Census of Manufactures, Motor Vehicle and Textile Industry Plants, 1929, 1931, 1933, 1935 [United States] (ICPSR 31761)." Changes from the earlier version include:

- 1) Formatted in Stata 8 and higher.
- 2) Missing information of product types, numbers and values entered.
- 3) Information for new 31 motor vehicle plants in 1931 added.
- 4) Unique and consistent ID given to establishments across the four census years.
- 5) Incorrect information edited.

Scope & Coverage

Countries: United States

Universe: All U.S. motor vehicle/ cotton goods establishments with annual output more than \$5,000

Unit of Analysis: Production establishment

Abstract

The U.S. Census Bureau has conducted surveys of manufacturing activity since 1810 as a part of the Decennial Census. In the twentieth century, the frequency increased but also fluctuated. A Census of Manufactures (CM) was conducted quinquennially from 1904 to 1919, biennially from 1919 to 1939, and then in the years 1947, 1954, 1958, and 1963. Regular quinquennial production resumed in 1967 as part of the Economic Census. The Economic Census, including the Census of Manufactures, has been conducted in all years ending in -02 or -07 since then.

In addition, the Annual Survey of Manufactures (ASM) has been conducted on a very large sample of manufacturing establishments every year since 1949. The U.S. Census Bureau's Center for Economic Studies currently makes available establishment-level microdata from 1963, 1967, and 1972 onward (Nucci 1998). Additional ASM and CM microdata dating back to at least 1954 have recently been recovered but not yet integrated with existing data (Becker and Grim 2011). These post-World War II micro data are not public, but are accessible by qualified researchers with approved projects through the Census Bureau's Federal Statistical Research Data Centers (<http://census.gov/fsrdc>).

For pre-World War II period, however, minimal microdata have been available as many original schedules were either destroyed or lost. One of the only two available datasets is a sample from the 1850, 1860, 1870 and 1880 Censuses constructed by Jeremy Atack, Fred Bateman and Thomas Weiss (ICPSR 4048 and 4071). The other period for which the original returns are extant is the Great Depression period, years 1929, 1931, 1933 and 1935. The datasets described here were constructed from those original schedules.

These data were originally digitized by Timothy Bresnahan and Daniel Raff in order to construct a panel covering a wide array of industries. Their motivation was to address firm and plant heterogeneity in analyzing the effects of the Great Depression. They coded records of the biennial Census of Manufactures from 1929 to 1935, the only years for which original returns are available, housed in the National Archives, to produce an SPSS-format dataset. They matched plants across censuses by comparing name, location and additional information if necessary and assigned a unique ID.

In the project summary submitted to the National Science Foundation (Bresnahan and Raff 1990), they suggest a number of topics and areas that the data can serve: the role of market power in industrial supply at the trough of the Great Depression and issues in employment at individual production sites, from labor hoarding to intra-industry compensating differentials and unionism. The fundamental motivation was to provide the basis for microeconomic evidence for the study of the Great Depression. They selected diverse industries in terms of industrial organization, consumer/producer goods, durability, and technology. Their project covered motor vehicles, cotton goods, linoleum, matches, soap, petroleum refining, glass, blast furnaces, cigarettes, sugar refining, motor vehicles, and cotton goods datasets. In 2012, the motor vehicle and cotton goods datasets were deposited with ICPSR.

The dataset here is an edited version of the Bresnahan and Raff data. The

current version includes additional data that were missing in the original. It has also been reorganized, variables labeled, and transformed into Stata format. New IDs consisting of "state code + original ID" are assigned, and variables are re-named so that the starting letter indicates the type of information the variable contains. For example, variables starting with "a" have basic identifying information for each plant, such as name changes from the previous census. The variable naming conventions are:

- a. Basic information
- b. Products made and materials used
- c. Period reported
- d. Operation and working hours
- e. Employment, wages and salaries
- f. Costs and amount of materials used
- g. Value of products and processing tax (1933 and 1935)
- h. Power used
- i. Machinery
- j. Identifiers in the original dataset

For the textile data (216 Cotton Goods), in order to assure consistency in the reporting unit, a small number of duplicate records have been deleted and a number of records have been merged. The list of deleted and merged records is included at the end of the the variable list. Using "XRECORD" in the original dataset and "idcode" one can recover the records.

Several analyses were produced by Bresnahan and Raff and their students using these data. Bresnahan and Raff (1991) addresses the heterogeneity among continuing, exiting and entering plants in the automobile industry during the Depression. Bresnahan and Raff (1993) offers a more advanced discussion of the shutdown behavior of auto plants. Bertin, Bresnahan and Raff (1996) studies how local substitutability and scale economies of blast furnaces affect industry equilibrium. Several other studies have also used these data. Lee (2015a) analyzes the exit patterns of the automotive plants during the Great Depression, relating the plant dynamics to firm structure and production technology. Lee (2015b) examines how firm structure, multi-plant and downstream vertical integration affects plant performance in the cotton goods industry in the early twentieth century North Carolina, linking the Census data to another dataset compiled from state government publications.

Additional industry data have been digitized since the original Bresnahan and Raff project. Ziebarth (2013) coded schedules from the cement, macaroni, sugar refining, manufactured ice, agricultural implements, malt, boneblack, concrete, cane sugar, and radio industries. His primary interest was to study homogeneous goods to apply recent developments in industrial organization to disentangle pricing and physical productivity. Other study topics include collusion during the Depression (Chicu et al. 2014; Vickers and Ziebarth 2014) and how financial disruption affected the misallocation of resources (Scott and Zeibarth 2014). Zeibarth (2014) describes issues in the production of these datasets. These additional industries have not yet been made available to the general research community.

United States Census of Manufactures, 1929-1935, Motor Vehicle Industry

Variable Description and Frequencies

Note: Frequencies displayed for the variables are not weighted. They are purely descriptive and may not be representative of the study population. Please review any sampling or weighting information available with the study.

Summary statistics (minimum, maximum, mean, median, and standard deviation) may not be available for every variable in the codebook. Conversely, a listing of frequencies in table format may not be present for every variable in the codebook either. However, all variables in the dataset are present and display sufficient information about each variable. These decisions are made intentionally and are at the discretion of the archive producing this codebook.

CASEID: SEQUENTIAL RECORD IDENTIFIER

Based upon 668 valid cases out of 668 total cases.
